

I choose Mining extraction field of Geology and Mining Engineering in HSC examination (University entrance test). Luckily I was pleased to complete my undergraduate studies in mining extraction field of Geology and Mining Engineering in 2019. Being a new graduate in mining sector, It was related to renewable energy technology. This was a blessing that was granted to me. Since my interest is in renewable energy it has been occupied my mind when I studied mining engineering in Kabul Polytechnic University. It is a reputable university in Afghanistan which has been known for the highly competitive selection and scientific in mining engineering. I was one of the lucky people who could experience such a wonderful education process which has built my character and knowledge. Moreover, getting a chance to be supervised by a famous mining expert in doing my research on productivity of Talc has strengthened my motivation in devoting myself in mining sector. I found a chance in final year of University to start a research project about productivity enhancement of Talc Stones with an effective ways, unfortunately, we are living in a country where there is war because of war we don't have a standard mining operation system in our country and still we use very backward ways for mining operations and most of our mines are in insecure places because of that we didn't had any practical work in our University, that research was a big opportunity for me to improve my knowledge in mining sector In addition, I also had a chance to have three months practical work at Ministry of Mines and Petroleum which was very effective that has built my interest in mining sector. I generate a comprehensive picture about Afghanistan's environment mining problems and where a new design could be a part of the solution. In my mind, I am not only getting opportunity to apply my knowledge I obtained in my study but also gaining new knowledge about how policies could be an important factor to support the mining operation implementation. Being an engineer in a mining company who provides newest technology service for the mining operation surely is a big achievement for me after my graduation from university. Being graduate from university without having experience in student organization can bring about the imperfection for my student live. Furthermore, I get more experience in my research and practical work with Ministry of mines and petroleum about building network, friendship and working with various feelings and problems that have to be dealt with. I made some design for new technique for mining operations especially at productivity enhancement sector in my project, I think that these kind activities have increased my knowledge about mining until now, I had tried my best effort to accommodate all of my studies in that research.

I am actually a hard worker, enthusiastic, and very motivated person. I am also an extrovert and a confident person, I like making friend, building new networks, easily getting along with other people and being involved in community activities. When I was involved in productivity enhancement project in my university, for me it was utterly remarkable chance because I could utilize and develop my knowledge in technique and mining operation sector, Furthermore, I have determined my goal to be a mining engineer expert who could bring a new technique to the society and company. This is definitely the area in which to devote my attentions to both in my academic career and my future employment. This intention could be achieved if I enable to provide myself with excellent postgraduate education to improve my knowledge significantly.

I strongly want to get my master degree in relevant field(geology and mining) , I hope I will get a chance to attend my master degree in foreign country to get more chance to improve my knowledge about mining operations, I have plan to transfer gained knowledge and skills in optimized manner to my country and generation, I hope to have peace in our country in near future and start extraction of our natural resources which has very efficient role in a country economic, I have a plan to get a master

degree in management after master degree in my relative field and make myself a genuine engineer this will empower me with the excellent substantial knowledge to achieve and realize my dream,

Moreover, I strongly motivate myself to continue research activities in my own country after finishing my study to serve the people honestly and professionally.
