4. REAL-TIME PRACTICAL EDUCATION As Graduated as Mechanical Engineer, One of the major problems that I would like to solve is the Real practical Application of the content of Education. In our curriculum, We are limited only to theoretical knowledge which is not yet helpful in Real-time practical life situations. We are Engineers, and we build the nation, but we don't know the proper utilization, mechanism, and maintenance of the Machines in practical life. We are not really aware of the designing and drafting machines. so this becomes very important for us to learn and apply it practically. for example: in HVAC(heating, ventilation, and air conditioning,) we don't know how to execute the project? How to install HVAC? How to calculate heat load calculations? What is the use of a particular thing in a particular subject? We are only limited to classroom lectures. we just memorize the formulas and answers but what is the use of that formula and answers to daily life, we are really not aware of. If this execution can be applied practically then we can ensure we handle everything properly. So we must have a good platform to imply our knowledge so that we can increase our content to the best level as well we can give our best effort to our field. There are many advantages of including real-life practical life applications like it will help us to retain knowledge in our mind, develops a better understanding of knowledge, safety includes practice, motivate teamwork, and improve skills. Different steps should be followed to identify its solution and one of the first steps in our curriculum board must make a good team and send them for investigation in different places so that they can know how really students are learning and applying practical activities and knowledge in practical life. Seminars and Real-time Projects should be conducted in different places about the latest technology so that students can get updated information. The content that is to be taught should be imparted fully so that one can have a better understanding. One should formulate objectives, strategies, and life skills program development. There should be a development of training sessions for educators and teachers. Self-awareness programs, critical thinking, and interpersonal skills should also be integrated. Workshops should be imparted daily so that one can have a good practice in a related field. Site visits to the related fields should be implemented to have a better approach to material and building technology and also overview to project. Tools and materials should be identified by the users such that they can use particular tools and materials in a particular application. Proper guidance and co-operation should be followed by the students and the educators for good learning ease. At last, I would like to conclude that one must follow all the above objectives and strategies and have a better understanding of Real-time Practical Applications in the related fields so that they can know their significance to a greater extent with ease.
